

COMPOST YOUR WAY TO A HEALTHY & SUCCESSFUL GARDEN.

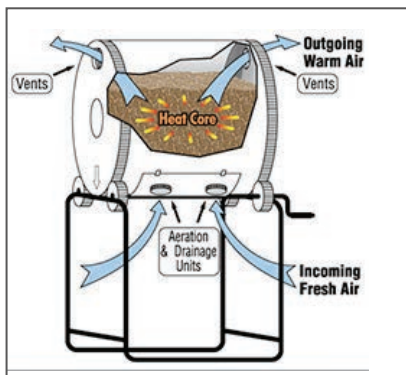

Compost is nature's best fertilizer and is good for the environment. Composting yard and kitchen waste reduces stress on landfills, conserves water and helps build fertile, greenhouse-quality soil.

40% of residential waste can be composted — but creating organically-rich compost can be messy, backbreaking and time consuming.

Now, turn leaves, grass clippings and kitchen waste into organically rich compost — **In as little as 14 days with a ComposTumbler from Mantis.** You'll be amazed at how one tool can create a constant supply of healthy fertilizer.

Our Scientific Advantage: How the ComposTumbler Does It!

Our unique design speeds up the composting process. You'll get finished compost in as little as 14 days! The key is keeping organic materials contained so that a heat core can be built quickly. The ComposTumbler has been precision designed for maximum efficiency in building a superior heat core. As the drum of the ComposTumbler is turned, the materials inside the composter mix and the core is stable.

Air and moisture are the other essential ingredients. Air vents are located on the sides of the drum so air flow is consistent during the compost process. Drains on the door allow for excess moisture to escape so materials won't get soggy.
